

## **A credit card company detects information leakage**

A credit card company implemented Intellinx for detecting information leakage and internal fraud. The company is using Intellinx for recording user activity in the corporate internal applications allowing the internal auditors to replay every screen and keystroke of every end-user. The company utilizes the Intellinx business rules for tracking end-user behaviour patterns generating alerts on exceptions in real-time. This effort was proved fruitful several weeks after the installation, when an employee who was misusing his authorized access was detected by the system.
